

# Sub-linear English Phrase-Checking

This is an example of how (a single shortcut/icon invocation) 'Graphein' r.3 (utilizing 'GAMERA' corpus r.15 x-gram corpora) phrase-checks two incoming .txt files derived from two .htm files published on TOP500 Supercomputing Sites (<http://www.top500.org>).

E:\\_Gamera\_Graphein>dir \_TXT-TREE/s

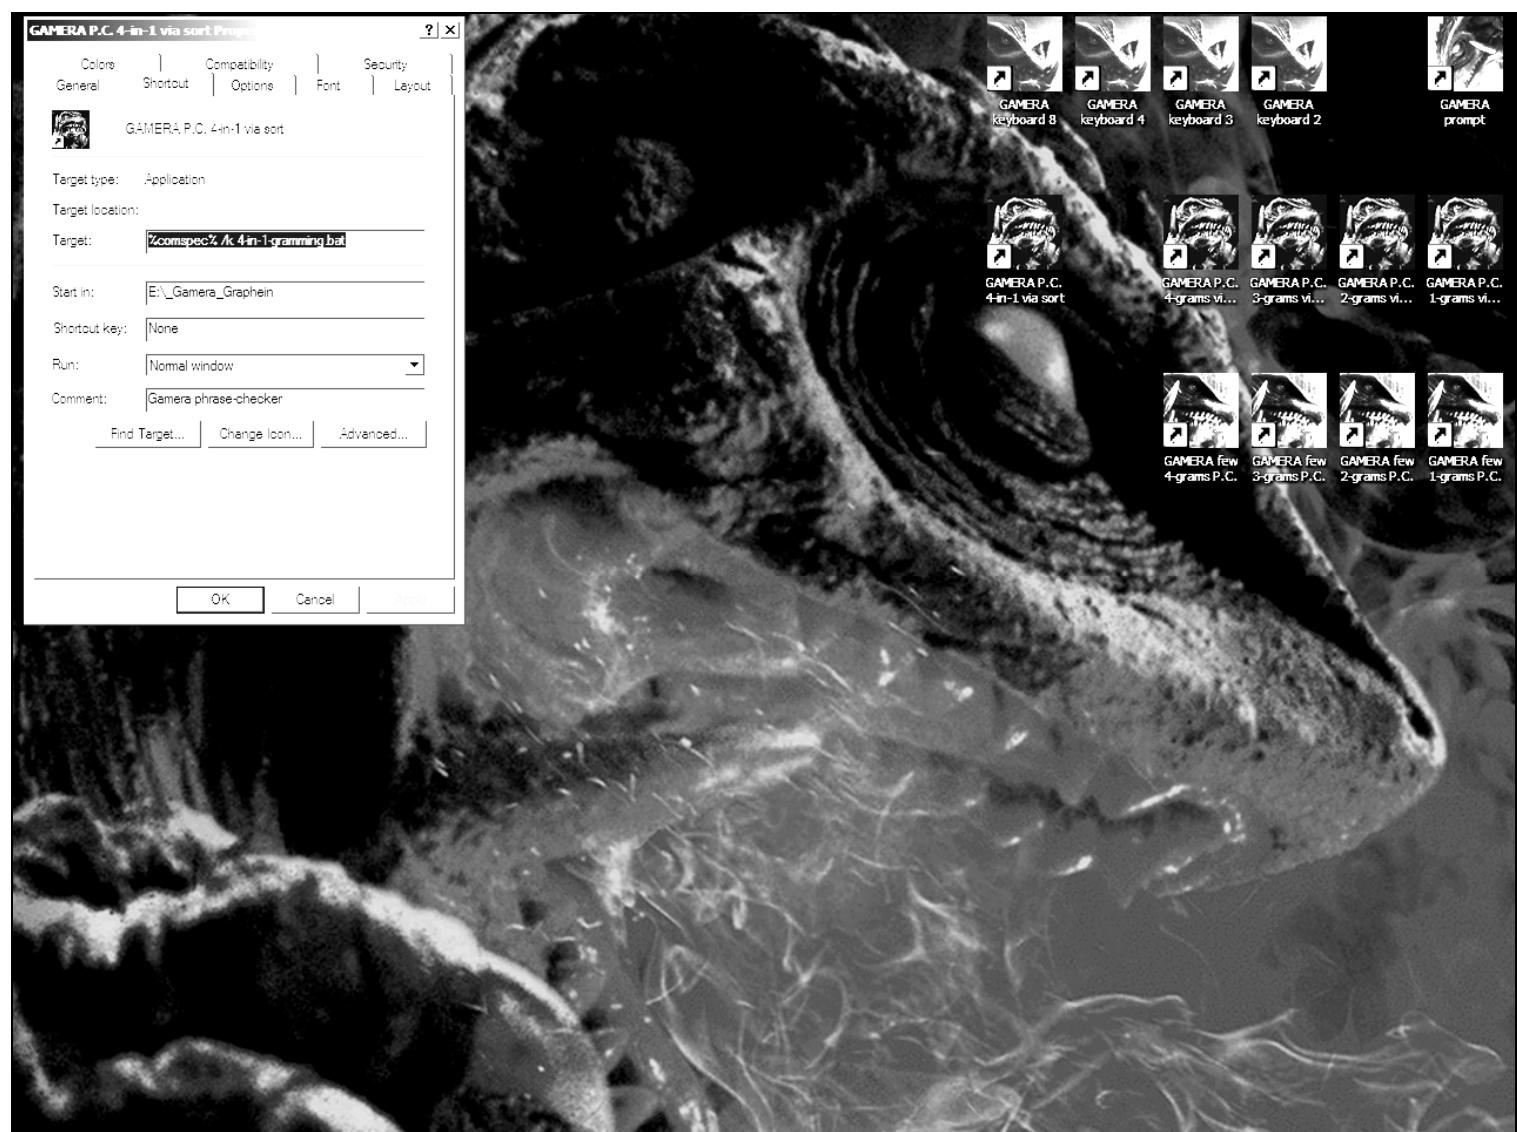

```
04/21/2012 02:56 AM      545,957 About Ivy Bridges and Tegra Hitches.pdf
04/21/2012 03:12 AM      7,916 About Ivy Bridges and Tegra Hitches.pdf.txt
04/21/2012 03:09 AM      212,280 Japan's K Computer.pdf
04/21/2012 03:14 AM      6,683 Japan's K Computer.pdf.txt
```

The table holds 'GAMERA' corpus r.15 x-gram corpora stats:

x-grams Order	x-grams Total Number	x-grams Distinct Number	x-grams Distinct Size
1-grams	4,589,933,215	9,181,275	207,307,606 bytes
2-grams	3,835,376,293	124,669,942	3,267,897,913 bytes
3-grams	3,286,567,380	477,829,381	14,630,478,827 bytes
4-grams	2,812,845,037	879,557,846	30,931,053,072 bytes

Here 'GAMERA P.C. 4-in-1 via sort' shortcut having been executed it gives us 16 resultant .TXT files of which 8 are most needed, see below.  
The whole task took 4:52:14.78 - 4:08:31.46 = (4\*3600+52\*60+14)-( 4\*3600+8\*60+31) = 2623 seconds.

Note: In next revision of 'Graphein' this time will be reduced significantly (combining Kazuya r19 and Overlapper-Blender\_X-GRAM r1+R into one tool thus avoiding unnecessary writes, after that going even further by replacing Kazuya r19 with Kazuya\_PTHREADED r0+++\_08-threads).

### Japan's K Computer.pdf.txt:

Published on /TOP500 Supercomputing Sites/ ([<http://www.top500.org/>](http://www.top500.org))

of 10 Petaflop/s, or 10 quadrillion calculations per second. In June 2011, the partially built K computer had taken the No. 1 position with a performance of 8.16 Petaflop/s. Contrary to many other recent very large systems, it does not utilize graphics processors or other accelerators. The K Computer is also one of the most energy efficient systems on the list.

### Japan's K Computer Tops 10 Petaflop/s to Stay Atop TOP500 List

By /admin/  
Created /2011-11-11 11:11/

BERKELEY, Calif.; KNOXVILLE, Tenn.; and MANNHEIM, Germany (Nov. 14, 2011)—Japan’s “K Computer” maintained its position atop the newest edition of the TOP500 List of the world’s most powerful supercomputers, thanks to a full build-out that makes it four times as powerful as its nearest competitor. Installed at the RIKEN Advanced Institute for Computational Science (AICS) in Kobe, Japan, the K Computer it achieved an impressive 10.51 Petaflop/s on the Linpack benchmark using 705,024 SPARC64 processing cores.

The K Computer is the first supercomputer to achieve a performance level

Still in second place is the Chinese Tianhe-1A system with 2.57 Petaflop/s performance. One year ago, the Tianhe-1A system took the top spot, but was dethroned when the next TOP500 list was published six months ago.

In fact, the Top 10 supercomputers on the latest list – the 38th edition of the twice-yearly list – remain unchanged from June 2011. The latest list, the data behind it and the trends it reflects will be the topic of a Birds-of-a-Feather session to be held at 5:30 p.m. Tuesday, Nov. 15, at the SC11 supercomputing conference in Seattle.

“This is the first time since we began publishing the list back in 1993 that the top 10 systems showed no turnover,” said TOP500 editor Erich Strohmaier, who will lead the discussion at SC11.

The largest U.S. system is a Cray XT5 system called Jaguar and installed

- An example of English phrase-checker ‘Graphein’ r.3 utilizing the Gamera r.15 corpus (powered by: 9,181,275 1-grams; 124,669,942 2-grams; 477,829,381 3-grams; 879,557,846 4-grams);
- The dump contains: **5** unfamiliar 1-grams out of **806**; **159** unfamiliar 2-grams out of **1526**; **600** unfamiliar 3-grams out of **1538**; **968** unfamiliar 4-grams out of **1376**;
- Two top500.org articles were x-gram-checked;  Downloaded from [www.sammayce.com](http://www.sammayce.com)

at the Oak Ridge National Laboratory, with a 1.75 Petaflop/s performance running the standard Linpack benchmark application. Other top U.S. systems include Cielo, a Cray XE6 at Los Alamos National Laboratory (No. 6); Pleiades, an SGI Altix machine at NASA's Ames Research Center (No. 7); Hopper, a Cray XE6 at the National Energy Research Scientific Computing Center (No. 8); and Roadrunner, an IBM system that was the first ever to break the Petaflop/s barrier, at Los Alamos (No. 10). Systems in China, Japan and France round out the Top 10.

Although the top rankings did not change, the newest list does highlight a number of other developments. For example:

- \* China keeps increasing its number of systems to 75 and is now clearly the No. 2 country, as a user of HPC, ahead of Japan, UK, France, and Germany.
- \* The two Chinese systems at No. 2 and No. 4 and the Japanese Tsubame 2.0 system at No. 5 are all using NVIDIA GPUs to accelerate computation.
- \* Thirty-nine systems use GPUs as accelerators (up from 17 six months ago), 35 of these use NVIDIA chips, two use Cell processors, and two use ATI Radeon.
- \* Already, 62 percent of the systems use processors with six or more cores.
- \* Intel continues to provide the processors for the largest share (76.8 percent) of TOP500 systems.
- \* Thanks to the K computer Fujitsu captured the No. 2 spot in market share by total performance slightly ahead of Cray, but IBM stays well ahead of both.

With every list, the entry level of performance just to claim the 500th spot increases. In the latest list, the level to the list moved up to the 50.9 Teraflop/s mark on the Linpack benchmark, compared to 39.1 Teraflop/s six months ago. The last system on the newest list was listed at position 305 in the previous TOP500 just six months ago. Total combined performance of all 500 systems has grown to 74.2 Petaflop/s, compared to 58.7 Petaflop/s six months ago and 43.7 Petaflop/s one year ago.

Other points of interest include:

- \* A total of 384 systems (76.8 percent) are now using Intel processors. This is slightly down from six months ago (386 systems 77.2 percent).
- \* They are now followed by the AMD Opteron family with 63 systems (12.6 percent), down from 66.
- \* The share of IBM Power processors has stabilized for now with 49 systems (9.8 percent), up from 45.

#### About Ivy Bridges and Tegra Hitches.pdf.txt:

Published on /TOP500 Supercomputing Sites/ ([<http://www.top500.org/>](http://www.top500.org))

#### About Ivy Bridges and Tegra Hitches

By /admin/  
Created /2012-04-10 03:13/

\*Andreas Stiller\* <<http://www.top500.org/contributors#stiller>> [1]

\* Gigabit Ethernet is still the most-used internal system interconnect technology (223 systems, down from 230 systems), due to its widespread use at industrial customers, followed by InfiniBand technology with 213 systems, up from 208 systems. However, InfiniBand-based systems account for almost twice as much performance (28.7 Petaflop/s) than Gigabit Ethernet ones (14.2 Petaflop/s).

\* IBM kept its lead in systems and has now 223 systems (44.6 percent) compared to HP with 140 systems (28.0 percent). HP had 146 systems (29.2 percent) six months ago, compared to IBM with 218 systems (43.6 percent).

#### Power consumption of supercomputers

TOP500 now tracks actual power consumption of supercomputers in a consistent fashion.

- \* 29 systems on the list are confirmed to use more than 1 megawatt (MW) of power.
- \* The No. 1 system, the K computer also reports the highest total power consumption of 12.66 MW. Yet due to its performance, the system is one of the most efficient systems on the list, delivering 830 Mflops/watt.
- \* The most energy efficient supercomputers are BlueGene/Q with 2,029 Mflops/watt.
- \* Average power efficiency is 282 Mflops/watt (up from 248 Mflops/watt six months ago and 219 Mflops/watt one year ago).
- \* Average power consumption of a TOP10 system is 4.56 MW (up from 4.3 MW six months ago) and average power efficiency is 464 Mflops/watt (unchanged).

#### About the TOP500 List

The TOP500 list is compiled by Hans Meuer of the University of Mannheim, Germany; Erich Strohmaier and Horst Simon of NERSC/Lawrence Berkeley National Laboratory; and Jack Dongarra of the University of Tennessee, Knoxville. (Translation of the German original in c't by Marcel Sieslack)

Intel causes confusion with the Ivy Bridge's launch date, HP starts a second restructuring attempt and Nvidia launches rumors about a Tegra 4 - all (amongst other things) because of Apple.

While everything is sprouting and leafing, Intel's plants need some extra time this year. And so, a certain ivy-overgrown bridge in the southern English town of Ivybridge still hasn't made it into the spotlight. As for the Ivy Bridge chip's launch date, even Intel has lost track by now: According to an internal diagram with more than half a dozen more or less reasonably scheduled dates, vendors are supposed to

- An example of English phrase-checker 'Graphein' r.3 utilizing the Gamera r.15 corpus (powered by: 9,181,275 1-grams; 124,669,942 2-grams; 477,829,381 3-grams; 879,557,846 4-grams);
- The dump contains: 5 unfamiliar 1-grams out of 806; 159 unfamiliar 2-grams out of 1526; 600 unfamiliar 3-grams out of 1538; 968 unfamiliar 4-grams out of 1376;
- Two top500.org articles were x-gram-checked;  Downloaded from [www.sammayce.com](http://www.sammayce.com)

start selling the dual-core processors of the Ivy Bridge generation before they are allowed to talk about them. We are eagerly awaiting the silent movie interludes behind the shop counters. In any case, Intel already gave us something to smile about when it tried to slip us a non-disclosure agreement for Z77 mainboards, which had already arrived in shops.

Apparently, it's not the brand new 22 nm production process with three dimensional FinFET transistors that is to blame for the delays, but the whims of big Intel clients. Allegedly, some of them have made changes to their orders in favor of the low and ultra-low voltage variants (LV and ULV) at the last minute. But only the best of the best silicon dice receive these energy efficiency classifications, and thus it takes longer to produce enough of them. Additionally, it appears that Apple has changed its mind on short notice and now wants chips with HD 4000 instead of HD 2500 graphics, which have 16 instead of only 6 shader units. However, taking into account that Intel is heavily advertising new ultrabooks with Ivy Bridge processors, it would seem a fatal mistake to make the ultrabook manufacturers and their clients wait in favor of Apple.

Meanwhile, the overall Ivy Bridge delay should make the large notebook manufacturers happy: they have a few more weeks to sell off their Sandy Bridge stocks at reasonable prices. The losers are the smaller competitors with empty warehouses. They will now have to equip brand new barebones with old Sandy Bridge processors for some weeks, which will most likely, to put it mildly, confuse the one or other client.

### Down the Valley

Ultimately, it might also stem from the "damper" the IT market as a whole received because of the hard disk shortage caused by the flood in Thailand: In the fourth quarter, the sales went down by 5.9 percent, which resulted in a meager annual plus of 1.3 percent. Unperturbed by this, Globalfoundries can rejoice over a quarter of a million wafers with 32 nm structures that the former AMD manufacturer has produced by now. And yet, Intel probably took note of this with a quiet smile and is already working on 22 nm Atoms with a powerful graphics core - codename "Valleyview". The GPU is supposed to originate from its large brother, Ivy Bridge, and be four times as fast as the current version. This doesn't mean a lot, but it could solve a pesky problem: Intel doesn't have any 64-bit drivers for the PowerVR graphics of the current Atoms, and the ones for 32 bits are nothing to be happy about.

### Angry Like a Wolf

Speaking of PowerVR: According to Jon Peddie Research, it's Imagination Technologies, maker of PowerVR, that dominates the SoC market. Reportedly, no other company sells more GPU designs: With a market share of 50 percent the company from the small town of Kings Langley near London easily leaves its competitors Qualcomm (33 percent), Vivante (4.8 percent) and Nvidia (3.2 percent) behind. Jen-Hsun Huang's "super chip" Tegra can currently be found in "superphones" and tablets, but things are not so "super" as far as the market share is concerned. Actually, regarding some topics, nerves seem to be raw in Santa Clara: For instance, Nvidia tried to completely cut us off from all communication concerning the new Kepler graphics card GeForce GTX 680 and also refrained from sending us a sample, because a previously published message simply didn't suit them.

It must have annoyed Nvidia's charismatic boss even more that Apple publicly and offhandedly commented on the weaker graphics performance of the Tegra 3 in comparison to the current iPad PowerVR core. That was at the beginning of March. And now, what a coincidence, there are rumors about the Tegra 4: It could feature a strongly downgraded Kepler architecture, which will have its debut in the GK104 of the desktop graphics card GeForce GTX 680. Supposedly, the mobile ULP GeForce core comes with somewhere between 32 and 64 shaders. Well, the numbers might be right, but why should Nvidia equip Tegra SoCs with cores compatible with shader model 5.1 when version 3.0, scheduled for this summer, of the OpenGL ES interface - the standard for mobile graphics - will only just introduce optional geometry shaders and is mainly derived from the old OpenGL 3? And for the much-discussed CUDA operations, which the Tegra 4 GPU should be able to manage, the unified shaders of model 4.0 are sufficient. For smartphone chips, the mantra is: Leave out what you don't need, because it saves space, reduces costs and makes the battery last longer.

This surely doesn't matter so much with the monster processor Power7+ from IBM. According to the first available pictures, it will pack four CPU dice on a giant ceramic module. It's still unclear, however, what's going to occupy the remaining space. Newcomer Adapteva would surely say: Cores, cores and more cores. Its processor Epiphany E4K has 4096 cores - admittedly, tiny ones - and is supposed to reach 5.632 teraflops at 700 MHz of clock speed while, nonetheless, consuming only 80 watts. If correct, the chip, produced in 28 nm structures by Globalfoundries, would be more efficient than all current GPGPU implementations or competitors like Larrabee and Knights Corner.

HP is meanwhile dreaming of equipping its own workstations with that knightly power. While the head of HP's department for workstation and thin clients, Jim Zarafana - obviously proud - presented new models and merrily philosophized about possible future workstation tablets with us, his boss started restructuring the company, again. Zarafana won't be affected though, as his business sector is growing quickly - even if mainly at the expense of the competition. However, the HP dinosaur "VJ" (Vyomesh Joshi) is being consigned to history after 31 years of service so that his Printing Group can be merged with the PC branch under the lead of Todd Bradley. After the failed attempt with Touchpad and webOS, this branch of the company would be well advised to quickly pull an iPad competitor out of its hat. Allegedly, HP - maybe with a partner -- is working on a Windows 8 tablet.

According to rumors, the upcoming Tegra 4 combined processors will feature a graphics unit with Kepler architecture. Nvidia only just introduced this architecture for graphics cards at the end of March, with the GK104 chip (see picture).

The first half of next phrase-checked (with **Gamera** corpus) 2-gram wordlist contains unfamiliar 2-grams whereas the second half holds all familiar to **Gamera** 2-grams with their corresponding occurrences:

Overlapped lines, i.e. lines common for both files: **1367**

Unfamiliar lines, i.e. lines from 1st file not encountered in 2nd file: **159**

The first half of next phrase-checked (with **Gamera** corpus) 3-gram wordlist contains unfamiliar 3-grams whereas the second half holds all familiar to **Gamera** 3-grams with their corresponding occurrences:

Overlapped lines, i.e. lines common for both files: **938**

Unfamiliar lines, i.e. lines from 1st file not encountered in 2nd file: **600**

# Japan's K Computer Tops 10 Petaflop/s to Stay Atop TOP500 List

By *admin*

Created 2011-11-11 11:11

BERKELEY, Calif.; KNOXVILLE, Tenn.; and MANNHEIM, Germany (Nov. 14, 2011)—Japan's "K Computer" maintained its position atop the newest edition of the TOP500 List of the world's most powerful supercomputers, thanks to a full build-out that makes it four times as powerful as its nearest competitor. Installed at the RIKEN Advanced Institute for Computational Science (AICS) in Kobe, Japan, the K Computer it achieved an impressive 10.51 Petaflop/s on the Linpack benchmark using 705,024 SPARC64 processing cores.

The K Computer is the first supercomputer to achieve a performance level of 10 Petaflop/s, or 10 quadrillion calculations per second. In June 2011, the partially built K computer had taken the No. 1 position with a performance of 8.16 Petaflop/s. Contrary to many other recent very large systems, it does not utilize graphics processors or other accelerators. The K Computer is also one of the most energy efficient systems on the list.

Still in second place is the Chinese Tianhe-1A system with 2.57 Petaflop/s performance. One year ago, the Tianhe-1A system took the top spot, but was dethroned when the next TOP500 list was published six months ago.

In fact, the Top 10 supercomputers on the latest list – the 38th edition of the twice-yearly list – remain unchanged from June 2011. The latest list, the data behind it and the trends it reflects will be the topic of a Birds-of-a-Feather session to be held at 5:30 p.m. Tuesday, Nov. 15, at the SC11 supercomputing conference in Seattle.

"This is the first time since we began publishing the list back in 1993 that the top 10 systems showed no turnover," said TOP500 editor Erich Strohmaier, who will lead the discussion at SC11.

The largest U.S. system is a Cray XT5 system called Jaguar and installed at the Oak Ridge National Laboratory, with a 1.75 Petaflop/s performance running the standard Linpack benchmark application. Other top U.S. systems include Cielo, a Cray XE6 at Los Alamos National Laboratory (No. 6); Pleiades, an SGI Altix machine at NASA's Ames Research Center (No.7); Hopper, a Cray XE6 at the National Energy Research Scientific Computing Center (No. 8); and Roadrunner, an IBM system that was the first ever to break the Petaflop/s barrier, at Los Alamos (No. 10). Systems in China, Japan and France round out the Top 10.

Although the top rankings did not change, the newest list does highlight a number of other developments. For example:

- China keeps increasing its number of systems to 75 and is now clearly the No. 2 country, as a user of HPC, ahead of Japan, UK, France, and Germany.
- The two Chinese systems at No.2 and No. 4 and the Japanese Tsubame 2.0 system at No. 5 are all using NVIDIA GPUs to accelerate computation.
- Thirty-nine systems use GPUs as accelerators (up from 17 six months ago), 35 of these use NVIDIA chips, two use Cell processors, and two use ATI Radeon.
- Already, 62 percent of the systems use processors with six or more cores.
- Intel continues to provide the processors for the largest share (76.8 percent) of TOP500 systems.
- Thanks to the K computer Fujitsu captured the No. 2 spot in market share by total performance slightly ahead of Cray, but IBM stays well ahead of both.

With every list, the entry level of performance just to claim the 500th spot increases. In the latest list, the level to the list moved up to the 50.9 Teraflop/s mark on the Linpack benchmark, compared to 39.1 Teraflop/s six months ago. The last system on the newest list was listed at position 305 in the previous TOP500 just six months ago. Total combined performance of all 500 systems has grown to 74.2 Petaflop/s, compared to 58.7 Petaflop/s six months ago and 43.7 Petaflop/s one year ago.

## Other points of interest include:

- A total of 384 systems (76.8 percent) are now using Intel processors. This is slightly down from six months ago (386 systems 77.2 percent).
- They are now followed by the AMD Opteron family with 63 systems (12.6 percent), down from 66.
- The share of IBM Power processors has stabilized for now with 49 systems (9.8 percent), up from 45.
- Gigabit Ethernet is still the most-used internal system interconnect technology (223 systems, down from 230 systems), due to its widespread use at industrial customers, followed by InfiniBand technology with 213 systems, up from 208 systems. However, InfiniBand-based systems account for almost twice as much performance (28.7 Petaflop/s) than Gigabit Ethernet ones (14.2 Petaflop/s).
- IBM kept its lead in systems and has now 223 systems (44.6 percent) compared to HP with 140 systems (28.0 percent). HP had 146 systems (29.2 percent) six months ago, compared to IBM with 218 systems (43.6 percent).

## Power consumption of supercomputers

TOP500 now tracks actual power consumption of supercomputers in a consistent fashion.

- 29 systems on the list are confirmed to use more than 1 megawatt (MW) of power.
- The No. 1 system, the K computer also reports the highest total power consumption of 12.66 MW. Yet due to its performance, the system is one of the most efficient systems on the list, delivering 830 Mflops/watt.
- The most energy efficient supercomputers are BlueGene/Q with 2,029 Mflops/watt.
- Average power efficiency is 282 Mflops/watt (up from 248 Mflops/watt six months ago and 219 Mflops/watt one year ago).
- Average power consumption of a TOP10 system is 4.56 MW (up from 4.3 MW six months ago) and average power efficiency is 464 Mflops/watt (unchanged).

## About the TOP500 List

The TOP500 list is compiled by Hans Meuer of the University of Mannheim, Germany; Erich Strohmaier and Horst Simon of NERSC/Lawrence Berkeley National Laboratory; and Jack Dongarra of the University of Tennessee, Knoxville. For more information, visit [www.top500.org](http://www.top500.org) [1]

# About Ivy Bridges and Tegra Hitches

By *admin*  
Created 2012-04-10 03:13

## [Andreas Stiller](#) [1]

(Translation of the German original in c't by Marcel Sieslack)

Intel causes confusion with the Ivy Bridge's launch date, HP starts a second restructuring attempt and Nvidia launches rumors about a Tegra 4 – all (amongst other things) because of Apple.

While everything is sprouting and leafing, Intel's plants need some extra time this year. And so, a certain ivy-overgrown bridge in the southern English town of Ivybridge still hasn't made it into the spotlight. As for the Ivy Bridge chip's launch date, even Intel has lost track by now: According to an internal diagram with more than half a dozen more or less reasonably scheduled dates, vendors are supposed to start selling the dual-core processors of the Ivy Bridge generation before they are allowed to talk about them. We are eagerly awaiting the silent movie interludes behind the shop counters. In any case, Intel already gave us something to smile about when it tried to slip us a non-disclosure agreement for Z77 mainboards, which had already arrived in shops.

Apparently, it's not the brand new 22 nm production process with three dimensional FinFET transistors that is to blame for the delays, but the whims of big Intel clients. Allegedly, some of them have made changes to their orders in favor of the low and ultra-low voltage variants (LV and ULV) at the last minute. But only the best of the best silicon dice receive these energy efficiency classifications, and thus it takes longer to produce enough of them. Additionally, it appears that Apple has changed its mind on short notice and now wants chips with HD 4000 instead of HD 2500 graphics, which have 16 instead of only 6 shader units. However, taking into account that Intel is heavily advertising new ultrabooks with Ivy Bridge processors, it would seem a fatal mistake to make the ultrabook manufacturers and their clients wait in favor of Apple.

Meanwhile, the overall Ivy Bridge delay should make the large notebook manufacturers happy: they have a few more weeks to sell off their Sandy Bridge stocks at reasonable prices. The losers are the smaller competitors with empty warehouses. They will now have to equip brand new barebones with old Sandy Bridge processors for some weeks, which will most likely, to put it mildly, confuse the one or other client.

## Down the Valley

Ultimately, it might also stem from the "damper" the IT market as a whole received because of the hard disk shortage caused by the flood in Thailand: In the fourth quarter, the sales went down by 5.9 percent, which resulted in a meager annual plus of 1.3 percent. Unperturbed by this, Globalfoundries can rejoice over a quarter of a million wafers with 32 nm structures that the former AMD manufacturer has produced by now. And yet, Intel probably took note of this with a quiet smile and is already working on 22 nm Atoms with a powerful graphics core – codename "Valleyview". The GPU is supposed to originate from its large brother, Ivy Bridge, and be four times as fast as the current version. This doesn't mean a lot, but it could solve a pesky problem: Intel doesn't have any 64-bit drivers for the PowerVR graphics of the current Atoms, and the ones for 32 bits are nothing to be happy about.

## Angry Like a Wolf

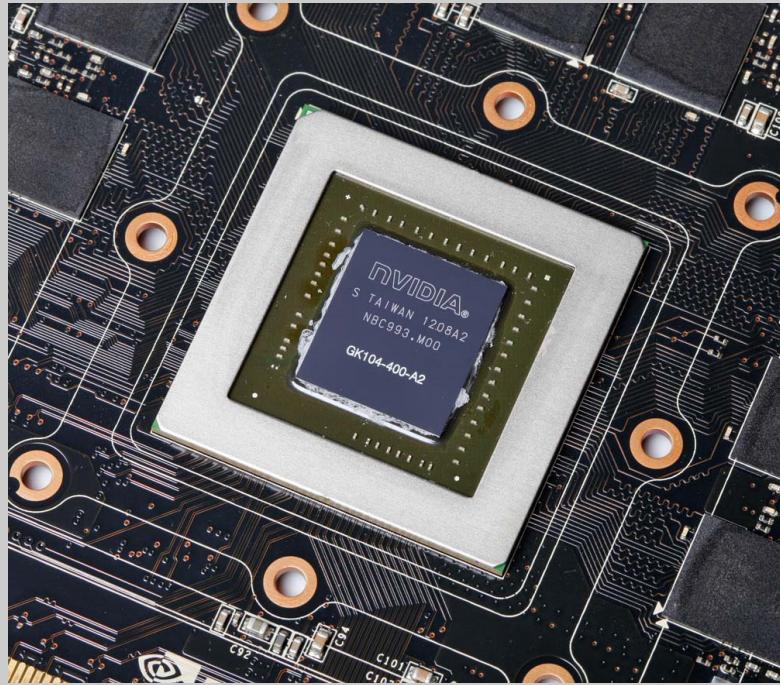

Speaking of PowerVR: According to Jon Peddie Research, it's Imagination Technologies, maker of PowerVR, that dominates the SoC market. Reportedly, no other company sells more GPU designs: With a market share of 50 percent the company from the small town of Kings Langley near London easily leaves its competitors Qualcomm (33 percent), Vivante (4.8 percent) and Nvidia (3.2 percent) behind. Jen-Hsun Huang's "super chip" Tegra can currently be found in "superphones" and tablets, but things are not so "super" as far

as the market share is concerned. Actually, regarding some topics, nerves seem to be raw in Santa Clara: For instance, Nvidia tried to completely cut us off from all communication concerning the new Kepler graphics card GeForce GTX 680 and also refrained from sending us a sample, because a previously published message simply didn't suit them.

It must have annoyed Nvidia's charismatic boss even more that Apple publicly and offhandedly commented on the weaker graphics performance of the Tegra 3 in comparison to the current iPad PowerVR core. That was at the beginning of March. And now, what a coincidence, there are rumors about the Tegra 4: It could feature a strongly downgraded Kepler architecture, which will have its debut in the GK104 of the desktop graphics card GeForce GTX 680. Supposedly, the mobile ULP GeForce core comes with somewhere between 32 and 64 shaders. Well, the numbers might be right, but why should Nvidia equip Tegra SoCs with cores compatible with shader model 5.1 when version 3.0, scheduled for this summer, of the OpenGL ES interface – the standard for mobile graphics – will only just introduce optional geometry shaders and is mainly derived from the old OpenGL 3? And for the much-discussed CUDA operations, which the Tegra 4 GPU should be able to manage, the unified shaders of model 4.0 are sufficient. For smartphone chips, the mantra is: Leave out what you don't need, because it saves space, reduces costs and makes the battery last longer.

This surely doesn't matter so much with the monster processor Power7+ from IBM. According to the first available pictures, it will pack four CPU dice on a giant ceramic module. It's still unclear, however, what's going to occupy the remaining space. Newcomer Adapteva would surely say: Cores, cores and more cores. Its processor Epiphany E4K has 4096 cores – admittedly, tiny ones – and is supposed to reach 5.632 teraflops at 700 MHz of clock speed while, nonetheless, consuming only 80 watts. If correct, the chip, produced in 28 nm structures by Globalfoundries, would be more efficient than all current GPGPU implementations or competitors like Larrabee and Knights Corner.

HP is meanwhile dreaming of equipping its own workstations with that knightly power. While the head of HP's department for workstation and thin clients, Jim Zarafana – obviously proud – presented new models and merrily philosophized about possible future workstation tablets with us, his boss started restructuring the company, again. Zarafana won't be affected though, as his business sector is growing quickly – even if mainly at the expense of the competition. However, the HP dinosaur "VJ" (Vyomesh Joshi) is being consigned to history after 31 years of service so that his Printing Group can be merged with the PC branch under the lead of Todd Bradley. After the failed attempt with Touchpad and WebOS, this branch of the company would be well advised to quickly pull an iPad competitor out of its hat. Allegedly, HP – maybe with a partner -- is working on a Windows 8 tablet.

According to rumors, the upcoming Tegra 4 combined processors will feature a graphics unit with Kepler architecture. Nvidia only just introduced this architecture for graphics cards at the end of March, with the GK104 chip (see picture).

## Project ‘GAMERA’ revision 15

(Semi-Powerful Console (Windows & Linux) Tools & gigabytes of English texts, downloadable from [www.sanmayce.com](http://www.sanmayce.com))

WHERE THE WORD COUNTS: A FREE sub-linear English phrase-checker

**Yoshi** (Filelist creator and more, 32bit console application), revision 7-

**Kazuya** (Text decompressor-finder-dumper, 32bit console application), revision 19

**GRAFFITH** (Text decompressor-finder-dumper, 32bit console application), revision 2++

**Graphein** (Fast and Greedy x-gram Ripper, 32bit/64bit Linux/Windows console application), revision 15fixfix

WinRAR archive in 32 624MB volumes • Required HDD/SSD space: 24.4 GB (ready to go when extracted on D:\) • 2012 APR 20

Gamera r.15 x-gram corpora stats: 1/2/3/4/8 respectively with 009,181,275/124,669,942/**477,829,381**/879,557,846/812,576,024 x-grams.

Gamera rips in sub-linear time (size of texts being checked matters a bit) all x-grams (here x is 1,2,3 or 4) from all your .TXT files located in the folder \_TXT-TREE (sub-directories allowed) and compares (phrase-checks) them against respective Gamera x-gram corpus creating four files: GALFONX\_overlapped\_all\_distinct.txt; GALFONX\_progenitor\_all\_distinct.txt; GALFONX\_unfamiliar\_all\_distinct.txt

When executing e.g. ‘GAMERA P.C. 3-grams via sort’ icon **GALFON3\_overlapped\_all\_digits\_distinct.txt** is auto-loaded into NOTEPAD:  
...  
enjoys\_widespread\_adoption  
enormous\_bigger\_than  
will\_occasionally\_forget

0,000,002  
0,000,001  
0,000,005  
...  
0,000,112

Number and size of all Gamera .TXT files (master-corpus): D:\>dir \_Gamera\\*.txt /og/on/s/b/a-d gives **562,504** files in **33,750,715,417** bytes, 6,528 folders.
